

PRESENTATION ABSTRACT

Presentation topic: THE DEVICE PERSPECTIVE

Speaker:

Account Manager, Pier Giorgio Torti

Company:

Pfeiffer/Valois, *Switzerland*

Presentation abstract:

In the last decades, both nasal and pulmonary delivery routes have been used successfully in treating conditions such as allergic rhinitis, asthma and more recently COPD. Supporting the development of the greatest innovations at the active molecules and drug formulation level, novel drug delivery devices have contributed significantly to pharma products' success in the market place. As far as nasal drug delivery is concerned, the transition from non-metering (drop or squeeze bottles) to more accurate dose metering systems have started years ago and it is today adding real value to marketed products at an even faster rate compare to what was previously expected. In pulmonary delivery as well, the administration of drugs to the lungs has proven to be safe, efficient and patient-friendly.
